

The reality of the hydropower dams as solutions for climate change

Andrea Rodríguez | Senior Attorney
COP 20 LIMA | December 2014

Why are large dams not clean energy sources?

- Fifty thousand large dams had been built by the year 2000, disrupting more than 60 percent of Earth's rivers.
- One of the major arguments for the current, unprecedented boom of dam construction around the world is that large hydro projects provide a "clean energy" solution to the climate crisis.
- On the contrary, scientific evidence reveals that **large dams are not clean or sustainable energy sources**

WHAT CAN YOU DO?

**Tell Leaders at COP20 That Large Dams Are
Not Part Of A Clean Energy Future!**
